

Host, Dedicated Host, Runner Host, Shared Host

◆ 1. What is a Host?

A **host** is a computer or server where applications, websites, or services run.

👉 Simple meaning:

A host is a machine that provides resources like CPU, memory, and storage to run programs.

✅ Example (EC2)

In Amazon Web Services, when you create an EC2 instance:

- That EC2 instance works as a **host**
- Your app (Node.js, Python, website) runs on it

🧠 Real-life Example

Host = House

Application = Person

Just like a person lives in a house, an application runs on a host.

◆ 2. Dedicated Host

A **dedicated host** is a physical server used by only one user or one company.

👉 No sharing with others

✅ Example (EC2)

In Amazon Web Services:

- You can launch EC2 on a **Dedicated Host**
- The full physical server is reserved only for you

Real-life Example

Dedicated Host = Your own house
No one else can use it

✓ Features

- High performance
 - High security
 - Full control
-

◆ 3. Shared Host (Shared Hosting)

A **shared host** is a server where multiple users share the same resources.

👉 Many users use one machine

✓ Example

- Many websites hosted on one server
- Cheap hosting services

Real-life Example

Shared Host = Hostel / PG
Many people live in one place and share resources

✓ Features

- Low cost
 - Limited performance
 - Less control
-

◆ 4. Runner Host (GitHub Actions)

A **runner host** is a machine that executes CI/CD jobs.

👉 It runs your automation tasks

✓ Example

In GitHub Actions:

- When you push code
- A **runner host** starts
- It builds, tests, and deploys your code

Real-life Example

Runner Host = Worker machine
It performs tasks given by GitHub

◆ 5. Types of Hosts

1 Local Host

- Your own computer
- Example: localhost (127.0.0.1)

2 Remote Host

- Server on internet
 - Example: EC2 instance
-

◆ 6. Comparison Table

Type	Meaning	Example
Host	Any machine running apps	EC2 instance
Dedicated Host	Full server for one user	AWS Dedicated Host
Shared Host	Server shared by many users	Shared hosting
Runner Host	Machine that runs CI/CD jobs	GitHub Actions runner

◆ 7. Final Summary

- Host = Machine where app runs

- Dedicated Host = Only you use the server
- Shared Host = Many users share one server
- Runner Host = Executes automation jobs

✓ This is very important for DevOps and Cloud concepts.
